AB	Twelve RR1N(CH2)2(CF2)nCF3 (I; R = Ph, 3-MeC6H4, 3-ClC6H4, or 1-ClO4H7; R1 = H, Et, CH2CH2CN, or CH2CH2OH; n = 1, 3, or 5) were prepared. Thus, reaction of PhNH2 with CF3CF2CH2CH2I gave 80.7% N-(3,3,4,4,4-pentafluorobutyl)aniline (II) [52671-65-5]. Similarly prepared were 4 other I. Ethylation of II gave 84.7% N-ethyl-N-(3,3,4,4,4-pentafluorobutyl)aniline [52298-66-5]. Similarly prepared was 1 other I.			

Reaction of II with CH<sub>2</sub>:CHCN gave 70.2% N-(cyanoethyl)-N-(3,3,4,4,4-pentafluorobutyl)aniline [52298-65-4]. Similarly prepared were 2 other I. Reaction of N-(3,3,4,4,4-pentafluorobutyl)-m-toluidine with ethylene oxide gave 75.5% N-(pentafluorobutyl)-N-(hydroxyethyl)-m-toluidine [52671-66-6]. Similarly prepared was 1 other I.

AB The preparation is given of perfluoroethyl iodide (C2F5I) (I) and longer chain title compds. C2F5(CF2CF2)nI (II), where n = 1 or greater, according to the reaction  $2I_2 + IF_5 + 5CF_2:CF_2 \rightarrow 5CF_3CF_2I$ . If the molar ratio of iodine to IF5 <2:1, products of formula II (mixture, various n values) result, usually in conjunction with varying amts. of I depending on the iodine to IF5 ratio. Thus, 0.66 mole iodine, 0.33 mole IF5 (III), and 0.0028 mole SbF5 were mixed at ambient temperature in a Hastelloy-C lined autoclave (2 moles iodine and 8.48 millimoles catalyst/mole III), the whole cooled <0°, evacuated to remove air, heated to 80° with agitation and CF2CF2 (IV) and 192 parts added slowly; the pressure rose to 200-50 lb./in.2 gage in <3 min., the temperature rose 8-26° after each addition in about 1 min. and then reverted to about 80° until 165 parts had been added. No temperature increase occurred during the addition of the

remaining 27 parts of IV. The mixture was kept 1 hr. at 80°, cooled and the volatile products collected in a refrigerated receiver at -60°. Mass-pectrometry, showed 98.3% I, 0.4% unreacted IV, 0.8% IF2CCF2I (V) and 0.4% perfluorocyclobutane (VI). The noncondensed gases contained 28.1 parts IV and 4.3 parts I. The yield of I was 98.5%, based on IV. When the reaction temperature was 60° rather than 80°, the condensed product contained 97.4% I, 0.7% IV, 0.6% VI, 0.7% V, and 0.4% other products; the yield of I was 98.1%. When the reaction was repeated with omission of the SbF5, the condensed product contained 98.5% I, 0.4% IV, 0.5% V and 0.5% VI, the oily residue contained 94.6% V and 4.4% I and the yield of I was 98.4% based on IV. The reaction was repeated with 0.0128 mole anhydrous SnF2; the condensed product contained 96.9% I, 0.6% IV, 0.8% VI, 0.3% V, and 1.3% other products. The yield of I was 99% based on IV. Similarly, other catalysts were used (catalyst, and amount (parts) and % yield of I given): CaF2, 2.0, 78; CrF3.3H2O, 2.0, 16; KF, 2.0, 18; HF, 100.0, 15; CoF2.2H2O, 2.0, 60; PbF4, 2.0, 39; CuF2, 2.0, 78; NiF2.5H2O, 2.0, 28; and AgF (50%), 2.0, 73. The following examples give the mixture of components. A mixture of 0.33 mole iodine, 0.182 mole III, and 0.0028 mole SbF3 (VII) was prepared at ambient temperature in a Hastelloy-C lined autoclave,

cooled to below 0°, evacuated, sealed, heated to 60° with agitation, and 1.21 moles IV added slowly in small increments in 1 hr. The reaction was exothermic, the pressure dropped rapidly from 150-250 lb./in.2 gage to <100 lb./in.2 gage, the temperature rose 7-44° after each addition. The mixture was kept at 70° 1 hr., cooled, the volatile products were vented through a H2O scrubber and a CaSO4 drying column, condensed in a refrigerated receiver at -60° and the condensed volatile material analyzed. It contained (in mole-%) 95.1 I, 1.2 C4F9I

(VIII), 0.5 IV, and 1 C2F6 (IX). The noncondensed gases were found to consist of 8.0 parts IV, 4.0 parts I, and 3.1 parts IX. The nonvolatile residue (100 parts) was washed with H2O and analyzed with a vapor phase chromatograph (in weight-%): I 21.1; VIII 28.7; C6F13I (X) 20.6; C8F17I (XI) 13.0; C10F21I (XII) 7.5; C12F25I (XIII) 4.1; C14F29I (XIV) 2.3; C16F33I (XV) 1.1. The combination of these analyses indicates that 96.9% IV is accounted for; % yields are as follows (based on IV consumed): I 48.8, VIII 15.8, X 12.3, XI 1.7, XV 0.9, and IX 0.6. Thus, the total yield of I was 95.8% and the total yield of products II was 47.1%. Iodine consumption was quant. Similarly, addnl. expts. were carried out with a varying ratio of iodine and III, as well as the temperature and the catalysts.

AB The synthesis of several SF5-containing fluoroalkyl iodides derived from an improved synthesis of SF5CF2CF2I are reported. These include SF5CF2CF2CH2CH2I, SF5(CF2)4I, SF5CF2CF2(CH2)4I, SF5CF2CF2CH:CHI and SF5CF2CF2CHFCF2I. The higher homologs SF5(CF2)6I, SF5CF2CF2(CHFCF2)2I and SF5CF2CF2(CH2CH2)3I were also identified.

AB Polyfluoroalkyl iodides are telomerized with polyfluoroolefins in the presence of strong fluorooxidizer initiators. The products obtained are useful in the production of surfactants and oil repellents. Tetrafluoroethylene and perfluorobutyl iodide were telomerized in the presence of XeF<sub>2</sub>.

AB XCF<sub>2</sub>CF<sub>2</sub>I [I; X = ClCF<sub>2</sub>CF<sub>2</sub>, Cl(CF<sub>2</sub>)<sub>4</sub>] readily react with the anion of Et acetoacetate in DMF to give XCF<sub>2</sub>C(CH<sub>2</sub>CO<sub>2</sub>Et):CHCO<sub>2</sub>Et (II), XCF<sub>2</sub>CF<sub>2</sub>H (III), Ac<sub>2</sub>CHCO<sub>2</sub>Et, and AcCH(CO<sub>2</sub>Et)CH<sub>2</sub>CH(CO<sub>2</sub>Et)Ac (IV). The reaction can be partly suppressed with 1,4-dinitrobenzene and the radical intermediate can be trapped by diallyl ether (DAE) to give the THF derivs. Anions of acetylacetone and malonitrile react also with I in the presence of DAE to yield the five-membered ring compds. All these results seem to indicate that the reaction is a radical chain process induced by electron transfer. In the case of XCF<sub>2</sub>CF<sub>2</sub>I (I; X = Cl), tetrafluoroethylene and IV, instead of II and III, are produced, showing the occurrence of  $\beta$ -fragmentation of the 2-halotetrafluoroethyl radical in the initiation step.

AB Title polymers are obtained from radical-polymerizable double bond-containing compds. [for example, (meth)acryloyl group-containing benzophenones, Ph salicylates, or benzotriazoles] and C4-21-polyfluoroalkyl or polyfluoroether-containing (meth)acrylates at mol ratio 90/10 - 10/90 and show weight average mol. weight (Mw) 1000-100,000. Thus, autoclaving 71 parts 2-(3'-hydroxy-4'-benzoyl)phenyloxyethyl methacrylate (I) and 126 parts perfluoroalkylethyl acrylate (II) in Me2CO in the presence of peroxybutyl isobutyrate under N at 65° gave a copolymer (III) with Mw .apprx.5000. A 25 µm-thick film extruded from a mixture of 100 parts ethylene-chlorotrifluoroethylene-tetrafluoroethylene copolymer and 5 parts of the III showed UV permeation 0% at 340 nm and 0.2% at 360 nm initially and 0 and 0.3%, resp., after 1000-h exposure to a Sunshine arc weatherometer.

AB Highly fluorinated epoxides react with halogens in the presence of nickel powder or CuI at elevated temps. to provide a useful and general synthesis of dihalodifluoromethanes (CF<sub>2</sub>X<sub>2</sub>) and fluoroacyl fluorides in the absence of solvent. At 185 °C, hexafluoropropylene oxide and halogens produce CF<sub>2</sub>X<sub>2</sub> (X = I, Br) in 68-90% isolated yields, along with small amts. of X(CF<sub>2</sub>)<sub>n</sub>X, (n = 2, 3). With interhalogens I-X (X = Cl, Br), a mixture of CF<sub>2</sub>I<sub>2</sub>, CF<sub>2</sub>XI, and CF<sub>2</sub>X<sub>2</sub> was obtained. The fluorinated epoxides substituted with perfluorophenyl, fluorosulfonyl, and chlorofluoroalkyl groups also react cleanly with iodine to give CF<sub>2</sub>I<sub>2</sub> and the corresponding fluorinated acyl fluorides in good yields. The reaction probably involves an oxidative addition of fluorinated epoxides into metal surfaces to form an oxametallacycle, followed by rapid decomposition to difluorocarbene-metal surfaces, which alters the reactivity of the difluorocarbene carbon from electrophilic to nucleophilic. The increase of nucleophilicity of difluorocarbene facilitates the reaction with electrophilic halogens. CF<sub>2</sub>I<sub>2</sub> reacted with olefins thermally to give 1,3-diiododifluoropropane derivs. Both fluorinated and non-fluorinated alkenes gave good yields of the adducts. Reaction with **ethylene**, propylene, perfluoroalkylethylene, vinylidene fluoride, and trifluoroethylene provided the corresponding adducts in 58-86% yields. With tetrafluoroethylene, a 1:1 adduct was predominantly formed along with small amts. of higher homologs. In contrast to **perfluoroalkyl iodides**, CF<sub>2</sub>I<sub>2</sub> also readily adds to perfluorovinyl ethers to give 1,3-diiodoperfluoro ethers. The formation of fluorocarbene was discussed.

AB Aromatic compds. were perfluoroalkylated with the appropriate **perfluoroalkyl iodide**. Some of the products were converted to dyes. The following reactions were run in a 180 ml. stainless steel rocking autoclave capped by a 3000 lb./sq. in. Ni rupture disk. n-C<sub>3</sub>F<sub>7</sub>I (90 g.) and 23.4 g. C<sub>6</sub>H<sub>6</sub> was heated 15 hrs. at 250°, the crude product filtered off, treated with Hg and distilled to yield 22.3 g. C<sub>3</sub>F<sub>7</sub>Ph, b<sub>760</sub> 132°, n<sub>25D</sub> 1.3790, and 1.5 g. isomeric (C<sub>3</sub>F<sub>7</sub>)<sub>2</sub>C<sub>6</sub>H<sub>4</sub>, n<sub>25D</sub> 1.3492. Likewise prepared were C<sub>7</sub>F<sub>15</sub>Ph (32% yield), b<sub>760</sub> 200°, n<sub>25D</sub> 1.3596, and (C<sub>7</sub>F<sub>15</sub>)<sub>2</sub>C<sub>6</sub>H<sub>4</sub> (4% yield), m. 88°. All subsequent reactions were run in heavy-walled 30 ml. glass ampuls. n-C<sub>7</sub>F<sub>15</sub>I (10 g.) and 0.9 g. PhMe was heated 14 hrs. at 290°, the mixture extracted with perfluorooxycycloheptane and distilled to give a 31% yield of C<sub>7</sub>F<sub>15</sub>C<sub>6</sub>H<sub>4</sub>Me, b<sub>760</sub> 217°, n<sub>25D</sub> 1.3678. Similarly prepared were: C<sub>7</sub>F<sub>15</sub>C<sub>10</sub>H<sub>7</sub> in 31% yield (from naphthalene), n<sub>25D</sub> 1.4160; C<sub>7</sub>F<sub>15</sub>C<sub>6</sub>H<sub>4</sub>CN in 26% yield (from

PhCN), b760 254°, m. 45-52°; C7F15C6H4Br in 30% yield (from PhBr), b760 237°, n25D 1.3870; C7F15C6H4I in 38% yield (from PhI), b760 253°, n25D 1.4152; C7F15C6H3(CO)2O (I) in 36% yield (from C6H4(CO)2O), m. 121-4°. I and glycerol in 3:2 mole ratio heated 4 hrs. at 220° gave fluorinated alkyd resins that had varnishlike properties. A perfluoroalkylated dye was prepared as follows: a 30 ml. glass ampul was charged with 1.4 g. Cu phthalocyanine and 10 g. n-C7F15I. The sealed ampul was heated 14 hrs. at 330°. Extraction with perfluorooxacycloheptane gave 4.4 g. C60F60H12N8Cu (I) (purity approx. 85%). Impurities were removed by vacuum sublimation to yield I, m. 300°, visible absorption at 6550-90 Å. and 6200 Å. I was soluble in fluorinated solvents only. Similarly perfluoroalkylated were the following: thioindigo (Color Index 1207), pyranthrone (Color Index 1096), violanthrone (Color Index 1099), and dichloroisoviolanthrone (Color Index 1104). The principal visible absorption peaks of the products were given. These dyes have been used to dye Teflon.

AB A method of forming a dual damascene semiconductor interconnection and an etchant composition specially adapted for stripping a sacrificial layer in a dual damascene fabrication process without profile damage to a dual damascene pattern are provided. The method includes sequentially forming a 1st etch stop layer, a 1st intermetal dielec., a 2nd intermetal dielec., and a capping layer on a surface of a semiconductor substrate on which a

lower metal wiring is formed; etching the 1st intermetal dielec., the 2nd intermetal dielec., and the capping layer to form a via; forming a sacrificial layer within the via; etching the sacrificial layer, the 2nd intermetal dielec., and the capping layer to form a trench; removing the sacrificial layer remaining around the via using an etchant composition including NH<sub>4</sub>F, HF, H<sub>2</sub>O and a surfactant; and forming an upper metal wiring within the thus formed dual damascene pattern including the via and the trench. The preferred etchant composition for stripping a sacrificial layer in the foregoing dual damascene process consists essentially of NH<sub>4</sub>F, HF, H<sub>2</sub>O and a surfactant.

AB A series of amphiphilic block copolymer having polyethylene oxide as the water soluble block were synthesized, and then esterified with **perfluoroalkyl iodide**. A second triblock copolymer was synthesized from **ethylene** oxide and hexafluoropropylene oxide. The aggregation behavior of the polymers and the interactions of the above block polymer with lipid monomers were also studied by surface pressure measurement and IRRAS.

AB A general synthesis of perfluoroalkylated amphetamines is presented. Initially, 1-aryl-1-iodo-2-(perfluoroalkyl)**ethylenes** are prepared by radical addition of **perfluoroalkyl iodides** to arylacetylenes. Key step of the reaction sequence is the following dehydroiodination in the presence of n-BuLi to give 1-perfluoroalkyl-2-arylacetylenes in situ, which are reacted with secondary amines to produce perfluoroalkylated enamines in a new one pot procedure. Final hydrogenation yields the desired products in good yields. By using N,N-dibenzylamine or N-benzylamines the corresponding primary and secondary perfluoroalkylated amines are easily available.

AB The Mo(II) and W(II) complexes [Mcp2L] (Cp =  $\eta^5$ -cyclopentadienyl; L = C<sub>2</sub>H<sub>4</sub>, CO) react with **perfluoroalkyl iodides** to give a variety of products. The Mo(II) complex [MoCp<sub>2</sub>(C<sub>2</sub>H<sub>4</sub>)] reacts with perfluoro-BuI or perfluorobenzyl iodide with loss of **ethylene** to give the 1st examples of fluoroalkyl complexes of Mo(IV), MoCp<sub>2</sub>(CF<sub>2</sub>CF<sub>2</sub>CF<sub>2</sub>CF<sub>3</sub>)I (8) and MoCp<sub>2</sub>(CF<sub>2</sub>C<sub>6</sub>F<sub>5</sub>)I (9), one of which (8) was crystallog. characterized. In contrast, the CO analog [MoCp<sub>2</sub>(CO)] reacts with perfluorobenzyl iodide without loss of CO to give the crystallog. characterized salt, [MoCp<sub>2</sub>(CF<sub>2</sub>C<sub>6</sub>F<sub>5</sub>)(CO)]<sup>+</sup>I<sup>-</sup> (10), and the W(II) **ethylene** precursor [WCp<sub>2</sub>(C<sub>2</sub>H<sub>4</sub>)] reacts with perfluorobenzyl iodide without loss of **ethylene** to afford [WCp<sub>2</sub>(CF<sub>2</sub>C<sub>6</sub>F<sub>5</sub>)(C<sub>2</sub>H<sub>4</sub>)]<sup>+</sup>I<sup>-</sup> (11). These observations demonstrate that the metal-C bond is formed 1st. In further contrast the W precursor [WCp<sub>2</sub>(C<sub>2</sub>H<sub>4</sub>)] reacts with perfluoro-BuI, perfluoro-iso-Pr iodide, and pentafluorophenyl iodide to give fluoroalkyl- and fluorophenyl-substituted cyclopentadienyl complexes WCp( $\eta^5$ -C<sub>5</sub>H<sub>4</sub>RF)(H)I (12, RF = CF<sub>2</sub>CF<sub>2</sub>CF<sub>2</sub>CF<sub>3</sub>; 15, RF = CF(CF<sub>3</sub>)<sub>2</sub>; 16, RF = C<sub>6</sub>F<sub>5</sub>); the Mo analog MoCp( $\eta^5$ -C<sub>5</sub>H<sub>4</sub>RF)(H)I (14, RF = CF(CF<sub>3</sub>)<sub>2</sub>) was obtained in similar fashion. The W(IV) hydrido compds. react with iodoform to afford the corresponding diiodides WCp( $\eta^5$ -C<sub>5</sub>H<sub>4</sub>RF)I<sub>2</sub> (13, RF = CF<sub>2</sub>CF<sub>2</sub>CF<sub>2</sub>CF<sub>3</sub>; 18, RF = CF(CF<sub>3</sub>)<sub>2</sub>; 19, RF = C<sub>6</sub>F<sub>5</sub>), two of which (13 and 19) were crystallog. characterized. The carbonyl precursors [MCp<sub>2</sub>(CO)] each react with perfluoro-iso-Pr iodide without loss of CO, to afford the exo-fluoroalkylated cyclopentadiene M(II) complexes MCp( $\eta^4$ -C<sub>5</sub>H<sub>5</sub>RF)(CO)I (21, M = Mo; 22, M = W); the exo-stereochem. for the fluoroalkyl group is confirmed by an x-ray structural study of 22. The **ethylene** analogs [MCp<sub>2</sub>(C<sub>2</sub>H<sub>4</sub>)] react with perfluoro-tert-BuI to yield the products MCp<sub>2</sub>[CH<sub>2</sub>CH<sub>2</sub>C(CF<sub>3</sub>)<sub>3</sub>]I (25, M = Mo; 26, M = W) resulting from fluoroalkylation at the **ethylene** ligand. Attempts to provide pos. evidence for fluoroalkyl radicals as intermediates in reactions of primary and benzylic substrates were unsuccessful, but trapping expts. with CH<sub>3</sub>OD (to give RFD, not RFH) indicate that fluoroalkyl anions are the intermediates responsible for ring and **ethylene** fluoroalkylation in the reactions of secondary and tertiary fluoroalkyl substrates.

AB Highly fluorinated cotelomers having the structure F(TFE)<sub>w</sub>(VDF)<sub>x</sub>(HFP)<sub>y</sub>(TrFE)<sub>z</sub>I containing one or several tetrafluoroethylene (TFE), vinylidene fluoride (or 1,1-difluoroethylene, VDF), hexafluoropropene (HFP) or trifluoroethylene (TrFE) base units were synthesized by thermal step-wise cotelomerization of these fluoroolefins with **perfluoroalkyl iodides**. <sup>1</sup>H and <sup>19</sup>F NMR allowed one to characterize these cotelomers and to assess the defects of chaining and the mol. wts. While the monoadduct produced from VDF exclusively exhibits RFCH<sub>2</sub>CF<sub>2</sub>I structure, that prepared from TrFE was composed of RFCFHC<sub>2</sub>F<sub>2</sub>I and RFCF<sub>2</sub>CF<sub>2</sub>HI isomers, the ratio of which is directed from the electrophilicity of RF<sup>•</sup> radical. The reactivity of the C-I bond in RF-Q-CXY-I depends on the nature of the Q spacer and on the reactivity of the fluorinated monomer (e.g., thermal initiations of VDF, TrFE and HFP were efficient from 180°, 195° and 210°, resp.). The mechanism of the addition of the radical generated from the iodinated transfer agent to the fluoroalkene is explained by means of its electrophilic attack to the more nucleophilic (i.e., the less electrophilic) side of the olefin. Ethylenation of these fluorocotelomers was successfully achieved from various initiations (thermal, redox or from peroxides) with best results from redox catalysis. Thermal properties of several fluorocotelomers (glass transition temps., T<sub>g</sub> and melting temps., T<sub>m</sub>) were assessed. They were linked to the number of consecutive CF<sub>2</sub> groups (for the crystalline zones) and bulky side groups which induced amorphous regions.

AB CF<sub>2</sub>I<sub>2</sub> reacted with olefins thermally to give 1,3-diiodofluoropropane derivs. Both fluorinated and non-fluorinated alkenes gave good yields of adducts. Reaction with **ethylene**, propylene, perfluoroalkylethylene, vinylidene fluoride, and trifluoroethylene provided the corresponding adducts in 58-86% yields. With tetrafluoroethylene, 1-to-1 adduct was predominantly formed along with small amts. of higher homologs. In contrast to **perfluoroalkyl iodides**, CF<sub>2</sub>I<sub>2</sub> also readily added to perfluorovinyl ethers to give 1,3-diiodoperfluoroethers.

AB Reactions of **perfluoroalkyl iodide** ICF(CF<sub>3</sub>)<sub>2</sub> with  
 [MCP<sub>2</sub>(C<sub>2</sub>H<sub>4</sub>)] (2, M = Mo; 3, M = W) afford the hydrido complexes  
 [{C<sub>5</sub>H<sub>4</sub>CF(CF<sub>3</sub>)<sub>2</sub>}(Cp)]MHI (4, M = Mo; 5, M = W) quant. The structure of 5  
 has been confirmed by x-ray crystallog.; monoclinic, P 31/c, a = 6.268(2),  
 b = 33.748(6), c = 7.616(2) Å, β = 112.01(2)°, V =  
 1493.6(6) Å<sup>3</sup>, Z = 4. In contrast, the tertiary **perfluoroalkyl**  
**iodide** IC(CF<sub>3</sub>)<sub>3</sub> reacts with 2 or 3 cleanly at the **ethylene**  
 ligand to give 6 and 7. X-ray crystallog. also confirms the structure of  
 7; monoclinic, P2<sub>1</sub>/n, a = 12.8936(1), b = 7.557(1), c = 38.9142(2) Å,  
 β = 95.0237(2)°, V = 3777.46(6) Å<sup>3</sup>, Z = 8 (two chemical  
 identical, crystallog. independent mols.). Running these reactions in the  
 presence of radical traps like perdeuterotoluene or dihydroanthraene  
 provides no evidence for fluoroalkyl radical intermediates, but pos.  
 signatures for fluorocarbanion intermediates are provided by trapping  
 expts. with CH<sub>3</sub>OD, and by observation of fluoroolefins F<sub>2</sub>C:CF(CF<sub>3</sub>) and  
 F<sub>2</sub>C:C(CF<sub>3</sub>)<sub>2</sub> among the reaction products from ICF(CF<sub>3</sub>)<sub>2</sub> or IC(CF<sub>3</sub>)<sub>3</sub> resp.

AB The title compds. comprise a mixture of straight and branched perfluoroalkyl groups bonded to Cl, Br, or I through a F-free alkylene group. Perfluorodecyltetrahydroiodide (prepared from perfluorosulfonyl fluoride, 40% straight and 60% branched, treated first with I, then with C<sub>2</sub>H<sub>4</sub>) was derivatized to thiol functionality by treatment with thiourea in EtOH to give perfluorodecyltetrahydrothiol (I). I was added to a reaction mixture containing hexamethoxymethylmelamine to give a I-melamine condensate (II, 1:4 mol ratio). A 50/50 polyester/cotton fabric blend was treated with an emulsion of II at 0.3%, dried and cured at 150°, to give a fabric with oil resistance (AATCC 118-1975) 5 and 5 after 1 dry cleaning, vs. 3 and 2, resp., for a precursor perfluorodecyltetrahydroiodide having all straight chain perfluoroalkyl groups.

AB The free-radical addition of 2-(perfluoroalkyl)ethanethiols (RFCH<sub>2</sub>CH<sub>2</sub>SH) to alkenes, cycloalkenes, alkadienes and alkynes has been studied to determine (1) the mode of reaction, i.e., the stereochem., regiochem. and any skeletal changes; (2) the relative reactivity towards unsats. of various structures and classes as affected by the presence of the RF group; and (3) the influence of the reaction conditions on the rate of addition or selectivity for different products. Adducts from 2-(F-hexyl)ethanethiol (1) and alkenes have been obtained in high yield, but containing small amts. of regio isomers. For example, compound 1 with 1-heptene gave 96% 1-[2-(F-hexyl)ethanethio]heptane, as well as 0.61% 2- and 2.22% 3-[2-(F-hexyl)ethanethio]heptane. Dienes gave chiefly linear adducts adducts; small amts. of cyclic isomers were also formed. Compound 1 added readily with free-radical initiation to vinyl monomers such as styrene and vinyl acetate, and to phenylacetylene, propargyl acetate and Et propynoate.

AB CF<sub>3</sub>(CF<sub>2</sub>)<sub>n</sub>C(CF<sub>3</sub>)<sub>2</sub>I (I, n = 1, 2) were obtained from CF<sub>3</sub>(CF<sub>2</sub>)<sub>n</sub>CF:C(CF<sub>3</sub>)<sub>2</sub> (n = 0, 1) by formal addns. of IF that required substantial alterations of known procedures. I (n = 1, 2) are the most reactive alkyl halides known so far, and they are also very toxic. The reactions studied included (a) Nucleophilic attack of anions at the iodine, leading to perfluoroalkenes, (b) elimination of IF, caused by metals or metal complexes, (c) pyrolysis, to selectively give perfluoroisobutene and **n-perfluoroalkyl iodides**, (d) photolysis, and (e) thermally induced insertions into the carbon-iodine bond. Screening results on the inhalation toxicity of the iodides and of some other fluoro-compds. are also reported.

AB **Perfluoroalkyl iodides** reacted with mono(perfluoroalkyl)**ethylenes**, and the addition products obtained were dehydriodinated to yield RCH:CHR<sub>1</sub> (R and R<sub>1</sub> are perfluoroalkyl and one or both of them is/are branched), useful in emulsions. A mixture of CH<sub>2</sub>:CHCF(CF<sub>3</sub>)<sub>2</sub> and (CF<sub>3</sub>)<sub>2</sub>CFI was heated at 200° to give (CF<sub>3</sub>)<sub>2</sub>CFCH<sub>2</sub>CHICF(CF<sub>3</sub>)<sub>2</sub>, which was treated with KOH in EtOH to give (CF<sub>3</sub>)<sub>2</sub>CFCH:CHCF(CF<sub>3</sub>)<sub>2</sub>.

AB New routes to fluorinated acetylenes were developed based on addns. of iodofluorocarbons to silylacetylenes. Free radical addition of  $\alpha$   $\omega$ -diiodoperfluoroalkanes to (trimethylsilyl)acetylene gave the iodotrimethylsilyl olefins  $\text{Me}_3\text{SiIC:CH}(\text{CF}_2)_n\text{CH:CISiMe}_3$ , which reacted with  $\text{KOCMe}_3$  or 1,8-diazabicyclo[5,4,0]undec-7-ene to give (trimethylsilyl)acetylenes and, with an excess of the base, the free diacetylenes. **Perfluoroalkyl iodides** similarly gave (perfluoroalkyl)acetylenes. The addition of perfluoroheptyl iodide to  $\text{PhC.tplbond.CH}$  followed by treatment with  $\text{KOCMe}_3$  gave 1-phenylperfluorononyne. The peroxide-catalyzed reaction of **perfluoroalkyl iodides** (RFI) and  $\text{Me}_3\text{SiC.tplbond.CSiMe}_3$  gave 1:1 adducts,  $\text{RF}(\text{Me}_2\text{SiCH}_2)\text{IC:CHSiMe}_3$ , resulting from intramol. H abstraction by the initially formed vinyl radical. The thermal reaction of **perfluoroalkyl iodides** and diiodides with bis(trimethylsilyl)acetylene in the presence of free iodine gave the (trimethylsilyl)acetylenes, which were desilylated with KF. A route to diacetylenes was investigated based on addition of perfluoroiodo compds. to **ethylene**, dehydroiodination, brominations, and eliminations.

AB Evaluation of 3 different methods for the modification of poly(**ethylene** terephthalate) fiber surfaces showed that coating the fibers with reactive group-containing additives from a dioxane solution followed by annealing produces the best results. The additives, e.g., an isomeric mixture of dihydrogen bis(4-perfluoroisopropoxy-3,3,4,4-tetrafluorobutyl)pyromellitates and mono(4-perfluoroisopropoxy-3,3,4,4-tetrafluorobutyl)phthalate [62478-07-3], were not simply deposited on the fiber surfaces, as demonstrated by scanning electron microscopy, but penetrated the fiber and interacted with the polymer matrix to form oligomers near the fiber surface. Additive concns. as low as 0.25% produced excellent water and oil repellency that was durable to washing and dry cleaning owing to the insoly. of the additives in soap solns. and dry cleaning solvents. The modified fibers could be knitted and dyed without affecting the surface properties.

AB A gaseous olefin (e.g., **ethylene**, propene, and 2-butene) or acetylene was bubbled through liquid **perfluoroalkyl iodide** [e.g., 1-iodoperfluoroheptane (I) and 1-iodoperfluorohexane] or a mixture of **perfluoroalkyl iodides** at .apprx.50-100° in the presence of a free radical generating catalyst to give the corresponding adducts, essentially free of telomers. Thus, **ethylene** was bubbled through a mixture of I and Bz2O2 at 80-5° for .apprx.10.5 h to give 1,1,2,2-tetrahydro-1-iodoperfluorononane (88.5% yield) free of telomers. About 18 other fluoroiodoalkanes or -alkenes were similarly prepared

AB The title preparation and telomerization, especially telomerization of tetrafluoroethylene (I) is described. Thus, 4.67 g. liquid ClF<sub>3</sub> was added with stirring at -70° to a solution of 33.4 g. n-C<sub>6</sub>F<sub>13</sub>I in 100 ml. perfluorohexane. The temperature raised by exothermic reaction to 0°, C<sub>6</sub>F<sub>14</sub> and excess C<sub>6</sub>F<sub>13</sub>I were evaporated in vacuo <0° to give C<sub>6</sub>F<sub>13</sub>IF<sub>2</sub>. Similarly, C<sub>2</sub>F<sub>5</sub>I and ClF<sub>3</sub> gave C<sub>2</sub>F<sub>5</sub>IF<sub>2</sub> with some C<sub>2</sub>F<sub>5</sub>IF<sub>4</sub>; 6 moles n-C<sub>4</sub>F<sub>9</sub>I with 1 mole ClF<sub>3</sub> gave n-C<sub>4</sub>F<sub>9</sub>IF<sub>2</sub>, m. 150°; 0.0337 mole n-C<sub>10</sub>F<sub>21</sub>I with 0.03 mole ClF<sub>3</sub> gave C<sub>10</sub>F<sub>21</sub>IF<sub>2</sub>, solid. Addition of 40.7 g. liquid ClF<sub>3</sub> to 206 g. n-C<sub>4</sub>F<sub>9</sub>I in 2614 g. C<sub>6</sub>F<sub>14</sub> at -80° gave a precipitate, dissolved by slow heating to -30°; the solution was cooled to -55°, and more 69.3 g. ClF<sub>3</sub> was added to give 80% n-C<sub>4</sub>F<sub>9</sub>IF<sub>4</sub> m. 10° (stable at -20°, but decomposed at room temperature). Dry He, saturated at 0° with ClF<sub>3</sub> vapor, was bubbled in C<sub>2</sub>F<sub>5</sub>I at 70° to absorb 2 moles ClF<sub>3</sub>, and the mixture was evaporated in vacuo <0° to give C<sub>2</sub>F<sub>5</sub>IF<sub>2</sub>, m. 18°. By the He-method, the reaction of 0.1 mole ClF<sub>3</sub> with 0.5 mole (CF<sub>3</sub>)<sub>2</sub>CFI at -70° gave 99% (CF<sub>3</sub>)<sub>2</sub>CFIF<sub>2</sub>, pasty solid; 0.1 mole ClF<sub>3</sub> with 0.5 mole C<sub>6</sub>F<sub>13</sub>I gave n-C<sub>6</sub>F<sub>13</sub>IF<sub>2</sub>, m. 35°; 25 g. CF<sub>3</sub>I in 30 ml. C<sub>6</sub>F<sub>14</sub> with He-ClF<sub>3</sub> at -80 to 30° gave a solid, decomposing 0°. A mixture of 42.6 g. C<sub>2</sub>F<sub>5</sub>I and 7 g. BrF<sub>5</sub> did not react at -50°; on heating, a violent reaction gave C<sub>2</sub>F<sub>5</sub>IF<sub>2</sub> and C<sub>2</sub>F<sub>5</sub>IF<sub>4</sub>. A similar reaction of 0.15 mole n-C<sub>4</sub>F<sub>9</sub>I with 0.06 mole BrF<sub>5</sub> at -80 to -30° gave an equimolar mixture of n-C<sub>4</sub>F<sub>9</sub>-IF<sub>2</sub> and C<sub>4</sub>F<sub>9</sub>IF<sub>4</sub>, m. 18°. The mixture of 0.1 mole n-C<sub>4</sub>F<sub>9</sub>I in 146 g. C<sub>6</sub>F<sub>14</sub> with 0.04 mole BrF<sub>5</sub> at -80 to 0° gave a mixture of 64% n-C<sub>4</sub>F<sub>9</sub>IF<sub>4</sub> and 36% n-C<sub>4</sub>F<sub>9</sub>IF<sub>2</sub>, m. 16°. A similar reaction of C<sub>4</sub>F<sub>9</sub>I with BrF<sub>3</sub> at the same conditions gave the same compds. For the telomerization, 5.9 g. C<sub>6</sub>F<sub>13</sub>IF<sub>2</sub> and 100 g. n-C<sub>3</sub>F<sub>7</sub>I in a glass autoclave in vacuo was heated to 70°, and 33.4 g. I was introduced at 70-8°/8.4 bar, in 10 min. After 32 min. at 70°, the pressure fell to 2.25 bar, to give a mixture of telomers F(CF<sub>2</sub>)<sub>n</sub>I with predominately odd n from 3 to 19. Other methods for telomerization of I are related, giving telomers with n 0-7, 1-6, 3-11, 2-20, with predominately odd or even n, using as telogen C<sub>4</sub>F<sub>9</sub>I and C<sub>2</sub>F<sub>5</sub>I, and as catalyst C<sub>4</sub>F<sub>9</sub>IF<sub>2</sub> and C<sub>3</sub>F<sub>7</sub>IF<sub>4</sub>. RIF<sub>2</sub> are more active as catalysts than RIF<sub>4</sub>. The telomerization of **ethylene** with n-C<sub>4</sub>F<sub>9</sub>I, catalyzed with n-C<sub>4</sub>F<sub>9</sub>IF<sub>2</sub>, at 60-80° gave a low yield of n-C<sub>4</sub>F<sub>9</sub>CH<sub>2</sub>CH<sub>2</sub>I and traces of telomers with n = 2,3,4. Similarly, vinyl fluoride gave n-C<sub>4</sub>F<sub>9</sub>CH<sub>2</sub>CHF<sub>2</sub>I, and vinylidene fluoride gave n-C<sub>4</sub>F<sub>9</sub>CH<sub>2</sub>CF<sub>2</sub>I, b760 120°.

AB **Perfluoroalkyl iodides** containing 6-12 C atoms may be

prepared by injecting C2F4 and a free radical-generating catalyst into a mixture of (1) a **perfluoroalkyl iodide** chosen from C2F5I and mixts. of C2F5I and C4F9I and (2) a portion of free radical generating catalyst. The mixture is heated to 80-170° under a pressure of 225-700 psi. The injection of the C2F4 mixture is continued until there are 0.25-1.2 moles of C2F4 per mole of **perfluoroalkyl iodide**. The amount of catalyst should be 0.25-0.9 weight-% of the total reaction mixture. Product yields of 70% or better are obtained. The preferred catalyst is di-tert-butyl peroxide. The preferred reaction temperature with

the

catalyst is 165°. The preferred mole ratio of C2F4-iodide is 0.4-1.1. The table gives yields obtained under various conditions. The products may be used as intermediates for preparing oil and water repellants for textiles and as intermediates for the preparation of perfluoroalkanecarboxylic acids which are surface active agents. Parts, 2F6I, C4F9I, Total tert-Bu2O2 used, weight %, Temperature, Ratio of C2F4 added

	IF5 73.3 is mixed at room temperature with 167.7 I and 0.5 part SbF <sub>3</sub> in a bomb jacketed with Hastelloy C. The bomb is cooled at 0°, purged of air and heated at 80° with stirring. C <sub>2</sub> F <sub>4</sub> (I) 192 parts is added portionwise over an hr. The pressure rises from 14 to 17 kg./cm. <sup>2</sup> after each addition After another hr. the bomb is vented through a water cleaner followed by a drying column (Drierite). The gases are collected at -60°. The non-condensed gas contains 4.3 parts C <sub>2</sub> F <sub>5</sub> I (II), while the condensed fraction (397 parts) contains 98.3% II, 0.4% I, 0.8% CF <sub>2</sub> ICF <sub>2</sub> I and 0.4% C <sub>4</sub> F <sub>10</sub> . The yield in II is 98.5% based on the consumed I. Other catalysts may be used (given: catalyst (2 parts) and yield in % II) SnF <sub>2</sub> , 99; CaF <sub>2</sub> , 78; CrF <sub>3</sub> .3H <sub>2</sub> O, 16; KF, 18; HF (100 parts), 15; CoF <sub>2</sub> .2H <sub>2</sub> O, 60; PbF <sub>4</sub> , 39; CuF <sub>2</sub> , 78; NiF <sub>2</sub> .5H <sub>2</sub> O, 28; AgF (50%), 73. Depending on the exptl. conditions, the following products were also obtained in the reaction mixture: C <sub>4</sub> F <sub>9</sub> I, C <sub>6</sub> F <sub>13</sub> I, C <sub>8</sub> F <sub>17</sub> I, C <sub>10</sub> F <sub>21</sub> I, C <sub>12</sub> F <sub>25</sub> I, C <sub>14</sub> F <sub>29</sub> I, C <sub>16</sub> F <sub>33</sub> I.

AB	The preparation is given of perfluoroethyl iodide (C <sub>2</sub> F <sub>5</sub> I) (I) and longer chain title compds. C <sub>2</sub> F <sub>5</sub> (CF <sub>2</sub> CF <sub>2</sub> ) <sub>n</sub> I (II), where n = 1 or greater, according to the reaction 2I <sub>2</sub> + IF <sub>5</sub> + 5CF <sub>2</sub> :CF <sub>2</sub> → 5CF <sub>3</sub> CF <sub>2</sub> I. If the molar ratio of iodine to IF <sub>5</sub> <2:1, products of formula II (mixture, various n values) result, usually in conjunction with varying amts. of I depending on the iodine to IF <sub>5</sub> ratio. Thus, 0.66 mole iodine, 0.33 mole IF <sub>5</sub> (III), and 0.0028 mole SbF <sub>5</sub> were mixed at ambient temperature in a Hastelloy-C lined autoclave (2 moles iodine and 8.48 millimoles catalyst/mole III), the				

whole cooled  $<0^{\circ}$ , evacuated to remove air, heated to  $80^{\circ}$  with agitation and  $\text{CF}_2\text{CF}_2$  (IV) and 192 parts added slowly; the pressure rose to 200-50 lb./in.2 gage in  $<3$  min., the temperature rose  $8-26^{\circ}$  after each addition in about 1 min. and then reverted to about  $80^{\circ}$  until 165 parts had been added. No temperature increase occurred during the addition of the remaining 27 parts of IV. The mixture was kept 1 hr. at  $80^{\circ}$ , cooled and the volatile products collected in a refrigerated receiver at  $-60^{\circ}$ . Mass-spectrometry, showed 98.3% I, 0.4% unreacted IV, 0.8%  $\text{IF}_2\text{CCF}_2\text{I}$  (V) and 0.4% perfluorocyclobutane (VI). The noncondensed gases contained 28.1 parts IV and 4.3 parts I. The yield of I was 98.5%, based on IV. When the reaction temperature was  $60^{\circ}$  rather than  $80^{\circ}$ , the condensed product contained 97.4% I, 0.7% IV, 0.6% VI, 0.7% V, and 0.4% other products; the yield of I was 98.1%. When the reaction was repeated with omission of the  $\text{SbF}_5$ , the condensed product contained 98.5% I, 0.4% IV, 0.5% V and 0.5% VI, the oily residue contained 94.6% V and 4.4% I and the yield of I was 98.4% based on IV. The reaction was repeated with 0.0128 mole anhydrous  $\text{SnF}_2$ ; the condensed product contained 96.9% I, 0.6% IV, 0.8% VI, 0.3% V, and 1.3% other products. The yield of I was 99% based on IV. Similarly, other catalysts were used (catalyst, and amount (parts) and % yield of I given):  $\text{CaF}_2$ , 2.0, 78;  $\text{CrF}_3 \cdot 3\text{H}_2\text{O}$ , 2.0, 16;  $\text{KF}$ , 2.0, 18;  $\text{HF}$ , 100.0, 15;  $\text{CoF}_2 \cdot 2\text{H}_2\text{O}$ , 2.0, 60;  $\text{PbF}_4$ , 2.0, 39;  $\text{CuF}_2$ , 2.0, 78;  $\text{NiF}_2 \cdot 5\text{H}_2\text{O}$ , 2.0, 28; and  $\text{AgF}$  (50%), 2.0, 73. The following examples give the mixture of components. A mixture of 0.33 mole iodine, 0.182 mole III, and 0.0028 mole  $\text{SbF}_3$  (VII) was prepared at ambient temperature in a Hastelloy-C lined autoclave, cooled to below  $0^{\circ}$ , evacuated, sealed, heated to  $60^{\circ}$  with agitation, and 1.21 moles IV added slowly in small increments in 1 hr. The reaction was exothermic, the pressure dropped rapidly from 150-250 lb./in.2 gage to  $<100$  lb./in.2 gage, the temperature rose  $7-44^{\circ}$  after each addition. The mixture was kept at  $70^{\circ}$  1 hr., cooled, the volatile products were vented through a  $\text{H}_2\text{O}$  scrubber and a  $\text{CaSO}_4$  drying column, condensed in a refrigerated receiver at  $-60^{\circ}$  and the condensed volatile material analyzed. It contained (in mole-%) 95.1 I, 1.2  $\text{C}_4\text{F}_9\text{I}$  (VIII), 0.5 IV, and 1  $\text{C}_2\text{F}_6$  (IX). The noncondensed gases were found to consist of 8.0 parts IV, 4.0 parts I, and 3.1 parts IX. The nonvolatile residue (100 parts) was washed with  $\text{H}_2\text{O}$  and analyzed with a vapor phase chromatograph (in weight-%): I 21.1; VIII 28.7;  $\text{C}_6\text{F}_{13}\text{I}$  (X) 20.6;  $\text{C}_8\text{F}_{17}\text{I}$  (XI) 13.0;  $\text{C}_{10}\text{F}_{21}\text{I}$  (XII) 7.5;  $\text{C}_{12}\text{F}_{25}\text{I}$  (XIII) 4.1;  $\text{C}_{14}\text{F}_{29}\text{I}$  (XIV) 2.3;  $\text{C}_{16}\text{F}_{33}\text{I}$  (XV) 1.1. The combination of these analyses indicates that 96.9% IV is accounted for; % yields are as follows (based on IV consumed): I 48.8, VIII 15.8, X 12.3, XI 1.7, XV 0.9, and IX 0.6. Thus, the total yield of I was 95.8% and the total yield of products II was 47.1%. Iodine consumption was quant. Similarly, addnl. expts. were carried out with a varying ratio of iodine and III, as well as the temperature and the catalysts.

AB cf. CA 60, 5532e.  $\pi\text{-C}_5\text{H}_5\text{Ni}(\text{CO})\text{Rf}$  [ $\text{Rf} = \text{CF}_3$ ,  $\text{C}_2\text{F}_5$ , or  $n\text{-C}_3\text{F}_7$ ] were isolated from reactions between dicarbonyl- $\pi$ -dicyclopentadienylnickel and **perfluoroalkyl iodides**. The related complexes were also obtained, namely,  $\pi\text{-C}_5\text{H}_5\text{Ni}(\text{CO})\text{Me}$ ,  $\pi\text{-C}_5\text{H}_5\text{Ni}(\text{Ph}_3\text{P})\text{C}_2\text{F}_5$ ,

and  $\pi$ -C<sub>5</sub>H<sub>5</sub>.Ni(Ph<sub>3</sub>P)I. Treatment of the salt K[ $\pi$ -C<sub>5</sub>H<sub>5</sub>.Ni(CO)] with perfluoroalkyl chloride gave a mixture of  $\pi$ -C<sub>5</sub>H<sub>5</sub>.Ni(CO)(CF<sub>2</sub>CF<sub>2</sub>) and  $\pi$ -C<sub>5</sub>H<sub>5</sub>.Ni(CO)(CF<sub>2</sub>CF<sub>2</sub>CF<sub>3</sub>). The probable constitution of the C<sub>4</sub>F<sub>5</sub> group in a new complex  $\pi$ -C<sub>5</sub>H<sub>5</sub>.Ni(Ph<sub>3</sub>P)C<sub>4</sub>F<sub>5</sub> was discussed. Reactions between dicyclopentadienylnickel and **ethylene**, hexafluorobut-2-yne, and butadiene were described.

AB cf. C.A. 44, 3875h, 4861d. I(CF<sub>2</sub>CF<sub>2</sub>)<sub>2</sub>I is prepared in high yield from ICF<sub>2</sub>CF<sub>2</sub>I and C<sub>2</sub>F<sub>4</sub> with heat, also from C<sub>2</sub>F<sub>4</sub> and iodine by heating under pressure; in both cases higher members of the series I(CF<sub>2</sub>CF<sub>2</sub>)<sub>n</sub>I are formed in amts. that can be varied by choice of temperature and pressure. The cyclic dimer of C<sub>2</sub>F<sub>4</sub> is a by-product in these reactions. The reaction is more conveniently carried out in stages in which each member of the series is converted into the next higher member. With lower members of the series, small amts. of the compds. formed with 2 or more C<sub>2</sub>F<sub>4</sub> mols. are produced and this tendency becomes greater with longer chains. Compds. containing up to 9 C<sub>2</sub>F<sub>4</sub> units have been prepared. A chain mechanism is proposed for these reactions. Compds. of greater chain length, from 10 to 20 C<sub>2</sub>H<sub>4</sub> units, are obtained by heating iodine with excess C<sub>2</sub>F<sub>4</sub> than by heating C<sub>2</sub>F<sub>4</sub>I<sub>2</sub>, C<sub>4</sub>F<sub>8</sub>I<sub>2</sub>, etc., with excess C<sub>2</sub>F<sub>4</sub> or from C<sub>2</sub>F<sub>4</sub> and excess iodine. Compds. with the general formula I(CF<sub>2</sub>CF<sub>2</sub>)<sub>n</sub>I have properties similar to those of CF<sub>3</sub>(CH<sub>2</sub>)<sub>n</sub>I; the lower members are liquids and the higher members are waxy solids. The compds. with n greater than 1 are much more stable than C<sub>2</sub>F<sub>4</sub>I<sub>2</sub>, but the C-I bonds are broken by heat or ultraviolet light to give the corresponding free radicals which undergo addition-polymerization with C<sub>2</sub>H<sub>4</sub>, C<sub>2</sub>H<sub>2</sub>, and yield organometallic compds. I(CF<sub>2</sub>CF<sub>2</sub>)<sub>n</sub>I with IF<sub>5</sub>, SbF<sub>5</sub>, or F diluted with N yield CF<sub>3</sub>(CF<sub>2</sub>)<sub>n</sub>I. Fluorocarbons are conveniently prepared in high yield up to C<sub>18</sub>F<sub>38</sub> from I(CF<sub>2</sub>)<sub>n</sub>I or CF<sub>3</sub>(CF<sub>2</sub>)<sub>n</sub>I with F diluted with N, IF<sub>5</sub>, IF<sub>7</sub>, or SbF<sub>5</sub> in an autoclave or by passing over heated CoF<sub>3</sub>. Pos. iodine is present in perfluoroalkyl mono- and diiodides and it may be replaced with H from alc. alkali or by irradiation in solvents such as hydrocarbons, alcs., and ethers. Br(CF<sub>2</sub>CF<sub>2</sub>)<sub>n</sub>Br and Cl(CF<sub>2</sub>CF<sub>2</sub>)<sub>n</sub>Cl and small amts. of Br(CF<sub>2</sub>CF<sub>2</sub>)<sub>n</sub>I or Cl(CF<sub>2</sub>CF<sub>2</sub>)<sub>n</sub>I are formed by the thermal or photochem. bromination or chlorination. Perfluoroalkyl dibromides have been converted into perfluoroalkyl monobromides with BF<sub>3</sub>. Perfluoroalkyl monobromides give fluorocarbons with excess BF<sub>3</sub> or SbF<sub>5</sub> under pressure. The conversion of perfluoroalkyl dichlorides into perfluoroalkyl monochlorides and fluorocarbons with F diluted with N, ClF<sub>3</sub>, or SbF<sub>5</sub> under pressure gives poorer yields than are obtained from the corresponding iodo and Br compds. Oils, greases, and waxy solids are obtained from long-chain fluorocarbons with fluorochlorocarbons or with small amts. of cyclic fluorocarbons. The lower perfluoroalkyl monoiodides form Grignard reagents that behave normally with water, CO<sub>2</sub>, and acyl halides; the latter give low yields.
